

UPDATED FUNCTIONAL GUIDE

YB Travel

Phase 1 Testing

A plain-language guide for management to understand the available features, test them safely, compare expected and actual results, and distinguish the deployed preview from the newer local release candidate.

GUIDE DATE	4 September 2026
PRODUCTION PREVIEW	http://2.24.28.178:4173
CURRENT PHASE 1	12 complete, 5 partial, 4 missing
LATEST FIX	WhatsApp voice-note delivery format corrected locally

Prepared for: YB Travel management
Purpose: independent functional review while the project owner is unavailable

How to use this guide

Read this page before opening the application.

The most important distinction

The production preview contains the features deployed through 2 September. Onboarding completion, request completeness, passenger fee calculation, approved Inbox templates, notes/documents/history, and the corrected voice-note delivery path were completed locally on 3-4 September and have not been deployed. Test those items only on the local release candidate or after an approved deployment.

Testing sequence

- Use the production preview only for low-risk review unless management has approved external WhatsApp actions.
- Use a dedicated test client, test travellers, a consenting test phone, and non-sensitive sample files.
- Follow the sections in order. Each table tells you what to do and what should happen.
- Mark each case Pass, Fail, Blocked, or Not available in the result sheet near the end.
- A green screen or visible button is not enough. Refresh and confirm that saved data remains correct.

Meaning of the status labels

Label	Meaning
Complete	The core flow saves real data, is visible, has API enforcement where required, and has automated regression coverage.
Partial	Some UI, data, or service behavior exists, but the complete business rule is not yet enforced.
Missing	The Phase 1 operational behavior is not implemented. A label, role name, or preview screen does not count.
Local only	Implemented in the current development workspace, but not available on the production preview yet.

02

Safety rules and test preparation

Prevent accidental client communication, data loss, and credential exposure.

Required preparation

Step	Action	Expected result
1	Confirm whether you are testing Production Preview or Local Release Candidate.	The environment name and URL are written in the test notes.
2	Sign in with a test System Administrator account. Do not share the password in screenshots or issue reports.	The Inbox opens and the header shows the signed-in role.
3	Choose or create a clearly named test client, for example 'Management Test - 04 Sep'.	Testing cannot be confused with a real customer record.
4	Use a WhatsApp number controlled by the tester and obtain consent before sending messages or creating a group.	No real customer receives test content.
5	Prepare one small PDF and one small JPG/PNG containing no passport, payment, or personal information.	Document tests can be completed safely.
6	Record the start time and browser. Use Chrome for microphone recording.	Failures can be matched to server records and reproduced.

Do not use destructive controls during ordinary testing

Do not choose Delete all test data. Do not disconnect the live WhatsApp number. Do not scan or share a WhatsApp QR code. These actions require a separate approved test window and a confirmed backup.

Evidence to keep for a failure

- Test case number, environment, date/time, user role, client/request number, exact action, expected result, actual result, and screenshot.
- Never include passwords, API keys, QR codes, passport details, payment information, or private message content.

03

Phase 1 completion status

The authoritative status of all 21 Phase 1 requirements in the current local candidate.

ID	Requirement	Current status
P1-01	WhatsApp requests and voice notes	Complete
P1-02	Find or create a client	Complete
P1-03	Passenger booking-fee calculation	Complete - local only
P1-04	Reusable family/dependant travellers	Complete
P1-05	Six client onboarding stages	Complete - local only
P1-06	Stage, missing steps, next action	Complete - local only
P1-07	Block completion until review	Complete - local only
P1-08	Required and missing details	Complete - local only
P1-09	Approved WhatsApp templates	Complete - local only
P1-10	Preferred/secondary/team assignment	Complete
P1-11	Notes, documents, unified history	Complete - local only
P1-12	Durable reminders	Partial
P1-13	Offshore Intake permissions	Partial
P1-14	Travel Agent permissions	Partial
P1-15	Supervisor/Manager permissions	Missing
P1-16	Ticketing Agent permissions	Missing
P1-17	Finance User permissions	Missing
P1-18	System Admin and access review	Partial
P1-19	Show/allow only permitted actions	Missing
P1-20	Multiple roles and high-risk grants	Partial
P1-21	All open requests in one place	Complete

Management statement

Phase 1 is not fully complete yet. Twelve requirements are complete in the current local candidate, five are partial, and four are missing. The largest remaining block is the central role and permission system, followed by durable reminders.

04

Login, navigation, and feature-status indicators

Confirm that staff can identify usable areas and recognize future-phase previews.

Feature

Authenticated staff enter the shared operational application. The navigation distinguishes working Phase 1 areas from later-phase previews. Hovering or focusing a construction icon explains why that item is not active.

Step	Action	Expected result
1	Open the environment URL. If redirected, enter an authorized test account.	Successful login opens the requested page. Invalid credentials do not reveal whether an account exists.
2	Review the top navigation: Inbox, Requests, Clients, Travellers, Bookings, Tickets, Reports, and More.	Working Phase 1 areas open normally. Future-phase areas show a construction icon or explanation.
3	Hover the icon beside Bookings.	It explains that booking/payment actions are planned for Phase 2 and current data is preview-only.
4	Hover the icon beside Tickets and Reports.	Ticketing identifies its later phase and Sabre dependency; Reports identifies demonstration figures.
5	Try More.	It remains disabled and explains that the additional menu is not implemented.
6	Choose Sign Out, then try a protected page URL.	The session ends and the protected page redirects to login.
Pass condition A manager can clearly tell which areas are operational and which are demonstrations without clicking through every screen.		

05

WhatsApp connection, disconnect, and history

Understand connection behavior before testing messages.

Feature

The Inbox shows Connected, Waiting for scan, or Disconnected. Disconnecting the linked WhatsApp device does not delete stored clients, conversations, requests, or messages. Reconnecting the same or a different phone continues to use the application history already stored in PostgreSQL.

Step	Action	Expected result
1	Open Inbox and read the connection status beside WhatsApp.	Connected shows the linked number. A disconnected state offers a retry and QR workflow.
2	Open an existing conversation and refresh the page.	The same message history remains available after refresh.
3	Administrator only: schedule a separate disconnect test and confirm a backup first.	No disconnect occurs during ordinary functional testing.
4	In the approved window, choose Disconnect WhatsApp and confirm.	The provider session logs out; application history remains visible.
5	Wait for the reconnect panel or choose Try connection again.	A fresh QR code appears if the saved session is no longer accepted.
6	Scan the QR with the approved test phone and refresh Inbox.	Status becomes Connected and previous application history remains.

Important
Changing the connected phone does not rewrite historical sender numbers or delete stored messages. It changes which WhatsApp account sends and receives future traffic.

06

Direct WhatsApp conversations and text messages

Test a normal one-to-one conversation with a consenting test phone.

Step	Action	Expected result
1	From Inbox, choose + New Conversation.	A phone-number entry flow opens.
2	Enter the test phone in international format, including country code.	Invalid or unregistered numbers are rejected; a valid WhatsApp recipient opens a conversation.
3	Enter a harmless unique message such as 'YB test 04 Sep 15:20' and choose Send once.	The message appears in history and the receiving phone receives it once.
4	Refresh the Inbox and reselect the conversation.	The outbound message remains in stored history.
5	Reply from the test phone with a different unique message.	The inbound message appears once; refreshing does not duplicate it.
6	Use conversation search by name or phone.	The correct conversation is filtered and selectable.

Meaning of the check mark
One check in this application means the provider accepted the message submission. It does not yet prove recipient delivery or reading. Confirm delivery on the receiving phone during acceptance testing.

07

Managed WhatsApp groups

Create, open, and contribute to a client-linked group.

Feature

A managed group links a WhatsApp group to a client and saved request, records its participants and creator, and opens the exact group conversation in the Inbox for ongoing messages.

Step	Action	Expected result
1	Open Managed Groups and choose + New Group.	The creation form opens.
2	Select the test client.	The newest request is selected automatically when available.
3	If no request exists, use the inline request form and choose Save request & continue.	The new request becomes linked to the group form.
4	Select at least one staff participant with a valid WhatsApp number and confirm the generated group name.	The readiness checklist identifies any remaining requirement.
5	Choose Create WhatsApp Group once.	One provider group is created and a managed-group row shows client, request, participants, status, and creator.
6	Choose the group name from Managed Groups.	Inbox opens with that exact group selected.
7	Send a harmless group test message.	The message appears in the selected group and on participant phones.

Duplicate protection
If the provider response is interrupted after creation, retry reconciliation uses the application-reserved group name to avoid creating another external group.

WhatsApp voice notes

Test outgoing delivery and incoming playback after the 4 September format repair.

Availability

The corrected WebM-to-Ogg/Opus delivery path is local only until deployment. The earlier 2:58 PM test item will not resend automatically. Use a newly recorded voice note for acceptance testing.

How it works

Chrome records microphone audio as WebM/Opus. Before WhatsApp submission, the API validates the file, converts it to WhatsApp-compatible Ogg/Opus push-to-talk audio, stores that normalized audio, and then submits it. Supported uploads include WebM, Ogg, MP4, MP3, and WAV up to 10 MB and one hour.

Step	Action	Expected result
1	Use Chrome on localhost or HTTPS, open Inbox, and select the consenting test phone conversation.	Record voice note is enabled while WhatsApp is connected.
2	Choose Record voice note, allow microphone access, speak for 3-5 seconds without personal information, and stop.	A recorded item is prepared for explicit sending.
3	Choose Send once.	The API converts and stores the note, then an outbound Play voice note bubble appears with one acceptance check.
4	Open WhatsApp on the receiving phone.	A playable push-to-talk voice note arrives and the audio is understandable.
5	Refresh the web Inbox and choose Play voice note.	The stored outbound audio still plays through the authenticated endpoint.
6	Send a new voice note from the phone back to the connected WhatsApp account.	An inbound Play voice note bubble appears and plays in the Inbox.
7	Optional HTTP preview fallback: upload a small non-sensitive audio file instead of recording.	The file is validated, normalized, sent, stored, and playable.

Failure evidence

Record the exact send time, conversation name/number, whether a bubble appeared, whether the receiving phone received it, and whether web playback works. Do not keep retrying the same note if the result is uncertain.

AI-assisted intake and request creation

Confirm that AI prepares work but never acts without employee approval.

Step	Action	Expected result
1	Ensure an administrator has configured and successfully tested the OpenAI key in Setup. Do not expose the key.	The provider is enabled and its saved value remains masked.
2	From the test phone, send a detailed travel request with route, approximate dates, passengers, and cabin.	The inbound text appears in Inbox.
3	Select the conversation and review AI Draft Intake.	The system proposes request type, urgency, summary, travel details, missing information, confidence, and a reply draft.
4	Change one proposed field before approval.	The edited value remains under employee control.
5	Choose Create Request only after reviewing all fields.	One real request with an R-number is created and linked to the conversation.
6	Open Requests in this conversation.	Every linked request is shown; choosing the new R-number opens its detail page.
7	Return to the composer and verify no AI response was sent automatically.	A human must still choose Send.

Human-control boundary
AI may classify, extract, identify missing information, and draft. It does not send, assign, ticket, charge, or create a request without an explicit employee action.

Clients, Inbox linking, and duplicate prevention

Test one client identity across searches, edits, and WhatsApp conversations.

Step	Action	Expected result
1	Open Clients and create a non-demo test client with a unique phone number.	The client is saved and opens as a real editable record.
2	Search by part of the name and by phone digits.	The same client is returned.
3	Edit a safe field, save, and refresh.	The new value persists.
4	Try to create another client using the same phone with different spacing or punctuation.	The duplicate is rejected or the existing matching client is identified.
5	Open an unlinked test WhatsApp conversation and choose the client-linking flow.	The conversation links to the existing client rather than creating another record.
6	Repeat the link/create action.	The operation is idempotent: it returns the same client and does not duplicate it.

Demo-data rule
Demo clients remain clearly identified and read-only. Hiding demo data must not change live test clients.

11

Travellers and reusable relationships

Confirm that passenger identities are reusable and protected.

Step	Action	Expected result
1	Open the test client and choose + Add Traveller.	A traveller form opens for that client.
2	Enter a legal name and date of birth; choose a relationship such as self, spouse, child, dependant, employee, or other.	The traveller is saved and linked to the client.
3	Add a second traveller and refresh the client.	Both linked travellers remain visible.
4	Open the traveller detail and edit a non-sensitive field.	The saved change persists after refresh.
5	Where the UI permits linking, connect an existing traveller to another test client rather than copying the profile.	One traveller record can have client-specific relationships.
6	Open passport detail only with an authorized operational user.	Broad lists remain redacted and the detail access is recorded without copying the passport value into audit metadata.

12

Client onboarding and completion gate

Local release candidate: test progression, tasks, required information, and review invalidation.

Step	Action	Expected result
1	Create a new test client and open its profile.	Stage is New inquiry; Onboarding Progress shows the next required action and stage history.
2	Add a traveller with legal name and date of birth.	Configured required values appear as present but review required.
3	Choose Confirm reviewed for each required value.	Each item records the reviewer and becomes complete.
4	Edit one reviewed value, then return to the client.	The prior review becomes stale and review required appears again.
5	Move onboarding forward one stage at a time.	Only the current and next forward stage are selectable; every move appears in history.
6	Move backward without a reason, then with a reason.	The first action is rejected; the reasoned move succeeds and records the explanation.
7	Enter a stage configured to generate a milestone task.	An open task appears with configured role, priority, and due time; Mark complete closes it.
8	Attempt Fully onboarded while any required item is missing or unreviewed.	The API blocks completion and identifies the exact blocker.
9	Complete and review all requirements, then move to Fully onboarded.	Completion succeeds transactionally and appears in stage history.

13

Request information and review status

Local release candidate: test structured travel details and required-information review.

Step	Action	Expected result
1	Open a real R-number request and choose Edit information.	The structured request-information form opens.
2	Enter origin, destination, departure date/window, passenger count, cabin, flexibility, and safe special requests.	Saved values remain visible after refresh.
3	Review the information checklist.	Airports and travel dates show review required when configured; empty optional fields do not block completion.
4	Confirm reviewed for the required groups.	The checklist becomes Complete when all configured requirements are satisfied.
5	Change a reviewed airport or travel date and save.	The value fingerprint changes and the review requirement reopens.

Why this matters
A visible value is not automatically trusted. The system records that a staff member reviewed the current value, and invalidates that evidence if the value later changes.

Booking fees and approved WhatsApp templates

Local release candidate: test reusable business rules and controlled client wording.

Passenger booking fee

Step	Action	Expected result
1	Give the test client an active booking-fee group and at least two linked travellers.	The request can use that client's fee rule.
2	Open the client's real request. In Booking fee by passenger, select travellers and Adult, Child, or Infant for each.	A per-passenger breakdown is visible.
3	Choose Save fee calculation.	Per-passenger rules charge enabled categories; per-booking rules charge once. Total and charged units are correct.
4	Refresh, then change the fee-group configuration.	The saved calculation keeps its original fee identity and amount; a new save creates a new snapshot.

Approved WhatsApp template

Step	Action	Expected result
1	Open a linked Inbox conversation and select Welcome (English), then choose Use template.	The client name is substituted and text enters the reply composer without sending.
2	Repeat with Booking fee or Missing information.	Available linked context is substituted. Missing context produces a visible unresolved-value warning.
3	Edit the prepared wording.	The draft remains editable; Send is always a separate deliberate action.

15

Notes, documents, and unified history

Local release candidate: test durable internal records and authenticated files.

Step	Action	Expected result
1	Open the test client and add an internal note under Notes, Documents & History.	The note shows author/time and remains after refresh.
2	Open a real request and add a different request note.	It stays scoped to that request; the client-only note is not copied into the request note list.
3	Upload the prepared PDF to the client with a description.	Filename, description, size, uploader, and time are stored.
4	Upload the JPG/PNG to the request.	The second document remains scoped to the request.
5	Choose each stored filename.	Authenticated download succeeds and the files open correctly.
6	Try an empty file, false extension, unsupported type, or file above 10 MB.	The upload is rejected by signature/size validation.
7	Review unified history.	Notes, documents, and linked WhatsApp text/voice activity appear newest first.

Data protection
Document bytes never appear in audit metadata. Download access is recorded as sensitive activity. Phase 1 deliberately does not offer document replacement or deletion, reducing accidental record loss.

16

Requests, assignment, deadlines, and notifications

Test ownership and accountability without changing the operational workflow incorrectly.

Step	Action	Expected result
1	Open Requests and search for the test R-number.	The live request appears with status and current owner; demo rows remain visibly separate.
2	Open the request detail.	Client, summary, type, urgency, response/service deadlines, assignment state, and history are visible.
3	Review Assignment recommendation.	The system explains preferred rep, secondary rep, continuity, team fallback, capacity/availability, or escalation reasoning.
4	As an authorized administrator/intake user, assign the request to an eligible test employee.	Ownership changes without changing the request's operational workflow stage.
5	Sign in as the assignee or inspect with that account.	A private notification appears and opens the exact request; marking it read updates only that user's notification.
6	Reassign with an explanation.	Assignment history stores actor, previous/new owner, time, reason, routing level, and recommendation snapshot.
7	As a Travel Agent, claim an unassigned test request.	Self-claim works only for an unassigned request and the action is audited.

Current reminder limitation
Immediate assignment notifications work. Durable timed reminders for unanswered inquiries, missing information, overdue next actions, acknowledgement, retry, and escalation are still partial Phase 1 work.

Administrator setup and test-data reset

Review configurable business controls; treat deletion as a separate high-risk test.

Setup area	What management can configure
Users	Accounts, multiple roles, active state, WhatsApp phone, availability, schedule, capacity, and qualifications.
Booking fees	Fee group, currency, amount, per-booking/per-passenger basis, category rules, and active state.
Onboarding	Ordered stages, completion stage, review gate, milestone task role/priority/duration.
Required information	Required client, traveller, and request fields, including review requirement.
Request workflow	Request types, statuses, urgency levels, response targets, and service targets.
Templates	Approved wording by purpose/language with supported variables.
Assignment	Routing order, availability/capacity, team strategy, continuity, fallback, and escalation roles.
AI provider	Encrypted OpenAI key, model, enable/disable, connection test, rotation, usage and estimated cost.
Demo/test data	Show/hide demo rows and gate the one-use destructive reset.

Delete all test data - do not test casually

- The Inbox button is hidden until a System Administrator enables its switch in Setup.
- The action requires typing DELETE ALL TEST DATA exactly and runs in one database transaction.
- It removes operational conversations/messages, groups, requests, clients, travellers, assignments, draft intakes, and notifications.
- It preserves user accounts, configuration, audit/security history, AI settings/usage history, and the WhatsApp authentication session.
- After success, the switch turns itself off. Test only after written approval and a verified backup.

Roles, permissions, and current limitations

Do not interpret the existence of a role name as complete authorization.

Role	Available now	Remaining Phase 1 work
System Administrator	Users/settings/integrations largely protected	Partial: access-history review and complete permission boundary remain.
Offshore Intake Employee	Role exists and is assignable	Partial: client/traveller endpoints are still too broadly available to authenticated users.
Travel Agent	Role exists, assignable, and can self-claim	Partial: explicit Phase 1 request/client permission enforcement remains.
Supervisor / Manager	Vocabulary exists	Missing: assignability plus workload, reassignment, and exception controls.
Ticketing Agent	Vocabulary exists	Missing: Phase 1 permission boundary; ticket operations remain later phase.
Finance User	Vocabulary exists	Missing: Phase 1 permission boundary; payment/refund work remains later phase.
Multiple roles	Stored and combined	Partial: only three roles assignable and no explicit high-risk grants.

What is needed to complete this block

Create one central permission catalogue, make all six roles assignable, enforce every Phase 1 API read/mutation, hide or disable unauthorized UI actions, add explicit high-risk grants, expose administrator access history, and test every single-role and multi-role combination.

Management test result sheet

Complete one line per test section and attach evidence only for failures.

Section	Test area	Status	Issue reference / note
04	Login/navigation/status icons	[]	
05	WhatsApp connection/history	[]	
06	Direct text conversation	[]	
07	Managed group	[]	
08	Outgoing/incoming voice notes	[]	
09	AI intake and request creation	[]	
10	Clients and duplicate prevention	[]	
11	Travellers and relationships	[]	
12	Client onboarding gate	[]	
13	Request information review	[]	
14	Fees and approved templates	[]	
15	Notes/documents/history	[]	
16	Requests/assignment/notifications	[]	
17	Administrator setup review	[]	
18	Role limitation understood	[]	

Use one of: Pass / Fail / Blocked / Not available

Issue format

Field	What to record
Environment	Production Preview or Local Release Candidate, plus URL.
Identity	User role only. Never record a password or secret.
Record	Test client, traveller, conversation, group, or R-number.
Action	Exact click/input immediately before the problem.
Expected / actual	Copy the expected result from this guide, then describe what happened.
Evidence	Time, browser, screenshot, and whether refresh/retry changed the result.

Management conclusion and next actions

A concise statement that can be used after testing.

The current local release candidate implements the central Phase 1 client-service workflow: WhatsApp text and voice communication, managed groups, client and traveller records, AI-assisted intake under human control, real requests, structured completeness review, onboarding gates, booking fees, approved templates, notes/documents/history, assignment, deadlines, and immediate assignment notifications.

Before Phase 1 can be declared complete

- Finish P1-12 durable reminders with due, overdue, acknowledgement, retry, and escalation behavior.
- Finish P1-13 through P1-20 role and permission enforcement, including all six roles and explicit high-risk grants.
- Run the complete role-based acceptance suite and resolve every failure.
- Deploy the approved local candidate with backup, migration, health, WhatsApp, and browser smoke checks.
- Obtain management acceptance before broader operational use.

Recommended decision

Use this guide to test the existing workflow in a controlled environment. Do not call Phase 1 complete and do not deploy the local-only changes until the remaining authorization/reminder work and acceptance results are reviewed.

Evidence basis

Prepared from the Phase 1 deliverables, completion matrix dated 3 September 2026, onboarding acceptance tests, project change log through 4 September 2026, current source behavior, automated regression results, and signed-in local browser verification. No password, API key, QR code, passport value, payment detail, or private credential is included.
